DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claim 1 is rejected under 35 U.S.C. 102(e) as being unpatentable over Schroath (US 2004/0169894).

Regarding claim 1, Schroath discloses a scanner (200, fig. 3) having a motor (226, fig. 4), a transmission gear (drive assembly 220) set coupled with the motor, a contact image sensor (receptor 210, fig. 4) and a belt (222, 223) connected between the transmission gear set and the contact image sensor, the improvement comprises:

a sensing assembly has a casing (206, fig. 2) adapted to be mounted on a side of a screen (platens 213 and 214, fig. 3, paragraph [0040]). Schroath discloses that there are typical electronic components used to perform the scanning process, however, he is silent on the specifics (paragraph [0030]). However, it is known to a person of ordinary skill in the art that a sensor or some other triggering mechanism must exist inside the scanning module (casing 206) in order to cause module's movement in response to, for instance, manipulation of scanner's operation panel (interface) or a start signal from a controlling unit.

Allowable Subject Matter

3. Claim 2 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims. The prior art does not disclose a scanner "...wherein the casing has a width and a recessed area defined in a side of the casing for receiving therein a piece of paper, the contact image sensor has a widthwise travel..."
